

SANDY PARKWAY OVERLAY - SANDY, UT

PROJECT DESCRIPTION

Northbound Sandy Parkway at the intersection with 90th Street was chosen as a good location for Sandy City's first trial of FORTA-FI® reinforced asphalt. This segment experiences a very high level of traffic as well as increased distress from braking and turning vehicles. After a 2" mill, a 2.5" FORTA-FI® reinforced overlay was placed using PG 64-35 ¾" mix. **The use of fiber reinforcement will help delay the onset of reflective cracking and reduce future maintenance requirements on this section of road.**

KEY POINTS

- Extended Pavement Life
- Reduced Rutting & Raveling
- Reduced Cracking

DETAILS

Date: 2015

Location: Sandy, UT

Fiber: FORTA-FI®

Distributor: Pacific GeoSource
